

Chapter 3

TECHNICAL BACKGROUND

Chapter 3 provides a detailed overview of the technical components required to implement your project. It serves as a foundational reference for readers—particularly technical evaluators—by presenting the technologies, tools, and platforms that support your system or application. This chapter demonstrates your awareness of the infrastructure needed to build and operate the solution you propose from various sources.

Software Requirements

Start with the Software Requirements, where you list and describe all software components necessary for development, deployment, and use of the system. This may include programming languages, frameworks, libraries, development environments, content management systems, database platforms, operating systems, or any third-party services and APIs. For each software item, indicate its specific role in the project, why it was chosen over alternatives, and any versioning requirements. Where applicable, explain compatibility considerations, licensing constraints, and dependencies between components. This section should reflect careful planning and technical knowledge of your project's backend and frontend environment.

Hardware Requirements

Follow with the Hardware Requirements, which outlines the physical and technical specifications of the equipment needed to run or test the system. This includes details such as computer or server specifications (CPU, RAM, storage), input/output devices, networking equipment, mobile devices, or any other hardware relevant to the system's functionality. Distinguish between development hardware and deployment hardware, if applicable. Include minimum and recommended specifications when relevant, and justify your choices based on the needs of your system in terms of performance, scalability, or portability.

Table 1

Label of the table

Hardware	Description
Processor	Intel Core i5-6200U Processor 2.3GHz
RAM	8098 MB DDR4 SDRAM 1065MHZ
Graphics	NVIDIA GEFORCE 920MX (2GB DDR3L)
Storage Capacity	1TB 5400RPM HDD
Smart phone camera	8 megapixels

Table 1 shows the hardware blah blah blah.
